

CASE STUDY: SACRED HEART PRESBYTERY NEW FACE LIFT

Electrical, security and AV for the newly refurbished Presbytery

With the appointment of a new Parish Priest, one of the first jobs that team GBIS were appointed to undertake was the installation of all the electrical services, accessories and intruder alarm system. Upon the completion of this, the next stage was to install a video door entry system that incorporated proximity access control, and was both reliable and user-friendly. The Presbytery was now looking like it belonged in the 21st century, it was now a place where the parishioners could gather to socialise, hold meetings and seminars.

GB Integrated Systems were also tasked to incorporate a state-of-the-art interactive smart board and audio visual system into the multi-use meeting/prayer room along with all the data and telephone cabling. The final request within this phase of improvements was to install a church TV system with a camera that allowed parishioners to log in and be able to view mass remotely, a function which has proved invaluable for the elderly and infirm of the Parish. All elements of team GBIS' work was completed with care, on time and within budget.
